

GitLab Setup Instructions for MP2-Part 4: Competition

1. You will first need to revisit the original GitLab Setup instructions posted in this Piazza note: <https://piazza.com/class/jzkq1yuj1so7ec?cid=46>
2. Go through steps 2 to 11 to fork the MP2_part4 repository and setup the GITLAB_API_TOKEN just as you did for previous MPs.
3. Create another variable with the name COMPETITION_ALIAS. In the value field, enter any alias name of your choice. This name will be displayed on the leaderboard for your submissions.

Variables ? Collapse

Variables are applied to environments via the runner. They can be protected by only exposing them to protected branches or tags. You can use variables for passwords, secret keys, or whatever you want.

| | | | | |
|--------------------|----------------------|-----------|-------------------------------------|---|
| GITLAB_API_TOKEN | ***** | Protected | <input checked="" type="checkbox"/> | - |
| COMPETITION_ALIAS | bhavya | Protected | <input checked="" type="checkbox"/> | - |
| Input variable key | Input variable value | Protected | <input checked="" type="checkbox"/> | - |

Save variables Reveal values

4. Follow the usual *git clone*, *commit* and check Pipelines process as listed in steps 12-15 of the original Setup instructions above. 5. If you've already forked and cloned the MP2_part4 repo before now, you will need to sync your fork with the original upstream master repo. Follow these git commands on your local terminal:

```
cd into/cloned/fork-repo

git remote add upstream
ssh://git@lab.textdata.org:222/cs410-fa19/MP2-FA19_part4.git

git fetch
upstream

git pull upstream
master
```
